## REAL EARNINGS – JANUARY 2012

### All employees

Real average hourly earnings for all employees was unchanged from December 2011 to January 2012, seasonally adjusted, the U.S. Bureau of Labor Statistics reported today. A 0.2 percent increase in the Consumer Price Index for All Urban Consumers (CPI-U) offset a 0.2 percent increase in the average hourly earnings.

Real average weekly earnings was unchanged over the month, as a result of both the real average hourly earnings and the average workweek remaining unchanged. Since reaching a peak in October 2010, real average weekly earnings has fallen 0.9 percent.

**Chart 1: Over-the-month percentage change in real average hourly earnings for all employees, seasonally adjusted, January 2011 – January 2012**

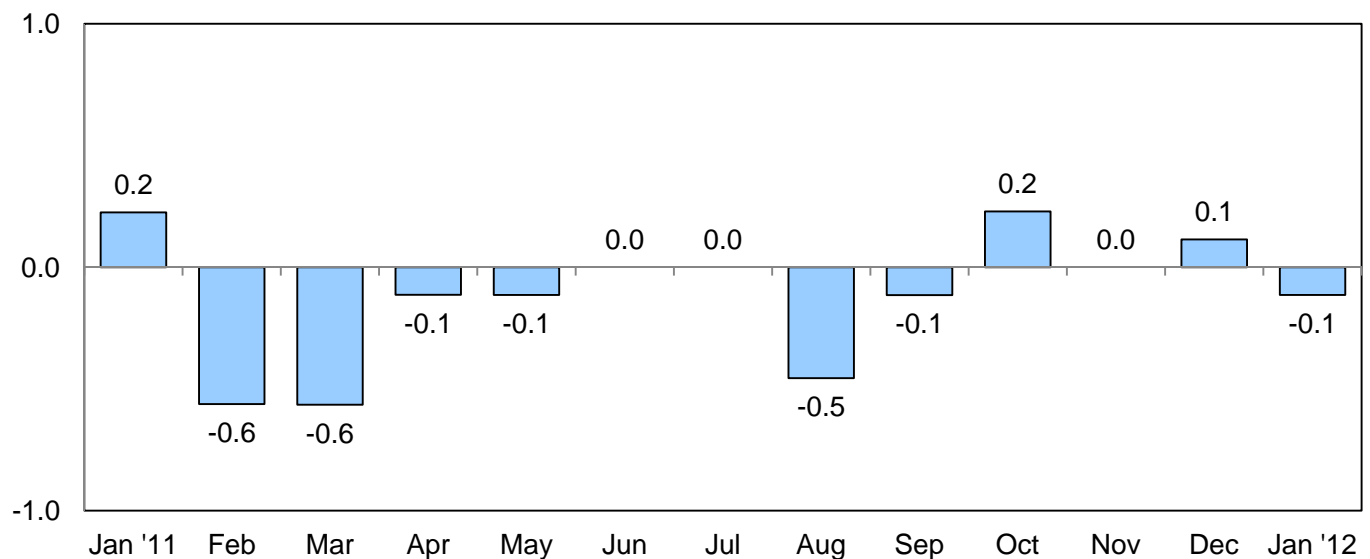

Real average hourly earnings fell 1.0 percent, seasonally adjusted, from January 2011 to January 2012. A 0.6 percent increase in the average workweek, combined with the decline in real average hourly earnings, resulted in a 0.4 percent decrease in real average weekly earnings during the same period.

## Production and nonsupervisory employees

Real average hourly earnings for production and nonsupervisory employees fell 0.1 percent from December 2011 to January 2012, seasonally adjusted. A 0.2 percent increase in the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) more than offset a 0.1 percent increase in the average hourly earnings.

Real average weekly earnings rose 0.2 percent over the month, as a result of a 0.3 percent increase in the average workweek and the decrease in real average hourly earnings. Since reaching a peak in October 2010, real average weekly earnings for production and nonsupervisory employees have fallen 1.3 percent.

**Chart 2: Over-the-month percentage change in real average hourly earnings for production and nonsupervisory employees, seasonally adjusted, January 2011 – January 2012**

Real average hourly earnings fell 1.7 percent, seasonally adjusted, from January 2011 to January 2012. The decrease in real average hourly earnings combined with a 1.2 percent increase in average weekly hours resulted in a 0.4 percent decline in real average weekly earnings during this period.

**Real Earnings for February 2012 is scheduled to be released on Friday, March 16, 2012 at 8:30 a.m. (EDT).**

### Revisions to Real Earnings Data

The seasonally adjusted constant dollar series presented in this release have been revised to reflect new seasonal adjustment factors calculated for the CPI-U and CPI-W. This revision affects real earnings for both all employees and production and nonsupervisory employees from January 2007 through December 2011.

The estimates of average weekly hours and average hourly and weekly earnings were revised with the release of January data on February 3, 2012 to reflect new employment benchmarks, and the updating of seasonal adjustment factors. Unadjusted data were revised from April 2010 forward. In addition, seasonally adjusted hours and earnings series were revised from January 2007 forward in accordance with the usual practice of revising 5 years of data.

1 Data relate to production employees in mining and logging and manufacturing, construction employees in construction, and nonsupervisory employees in the service-providing industries. These groups account for approximately four-fifths of the total employment on private nonfarm payrolls.

2 The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) is used to deflate the earnings series for production and nonsupervisory employees.

p Preliminary

# Explanatory Note

The earnings series presented in this release are derived from the Bureau of Labor Statistics' Current Employment Statistics (CES) survey, a monthly establishment survey of employment, payroll, and hours. The deflators used for constant-dollar earnings series presented in this release come from the Consumer Price Index Programs. The Consumer Price Index for All Urban Employees (CPI-U) is used to deflate the all employees series, while the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) is used to deflate the production employees series.

Seasonally adjusted data are used for estimates of percent change from the same month a year ago for current and constant average hourly and weekly earnings. Special techniques are applied to the CES hours and earnings data in the seasonal adjustment process to mitigate the effect of certain calendar-related fluctuations. Thus, over-the-year changes of these hours and earnings are best measured using seasonally adjusted series. A discussion of the calendar-related fluctuations in the hours and earnings data and the special techniques to remove them is available in the February 2004 issue of *Employment and Earnings* or on the Internet under 'Technical Notes' (<http://www.bls.gov/ces/>).

Earnings series from the monthly establishment series are estimated arithmetic averages (means) of the hourly and weekly earnings of all jobs in the private nonfarm sector of the economy, as well as of all production and nonsupervisory jobs in the private nonfarm sector of the economy. Average hourly earnings estimates are derived by dividing the estimated industry payroll by the corresponding paid hours. Average weekly hours estimates are similarly derived by dividing estimated aggregate hours by the corresponding number of jobs. Average weekly earnings estimates are derived by multiplying the average hourly earnings and the average weekly hours estimates. This is equivalent to dividing the estimated payroll by the corresponding number of jobs. The weekly and hourly earnings estimates for aggregate industries, such as the major industry sector and the total private sector averages printed in this release, are derived by summing the corresponding payroll, hours, and employment estimates of the component industries. As a result, each industry receives a "weight" in the published averages that corresponds to its current level of activity (employment or total hours). This further implies that fluctuations and varying trends in employment in high-wage versus low-wage industries as well as wage rate changes influence the earnings averages.

There are several characteristics of the series presented in this release that limit their suitability for some types of economic analyses. (1) The denominator for the all employee weekly earnings series is the number of private nonfarm jobs. Similarly, the denominator of the production employee weekly earnings series is the number of private nonfarm production and nonsupervisory employee jobs. This number includes full-time and part-time jobs as well as the jobs held by multiple jobholders in the private nonfarm sector. These factors tend to result in weekly earnings averages significantly lower than the corresponding numbers for full-time jobs. (2) Annual earnings averages can differ significantly from the result obtained by multiplying average weekly earnings times 52 weeks. The difference may be due to factors such as turnovers and layoffs. (3) The series are the average earnings of all employees or all production and nonsupervisory jobs, not the earnings average of "typical" jobs or jobs held by "typical" workers. Specifically, there are no adjustments for occupational, age, or schooling variations or for household type or location. Many studies have established the significance of these factors and that their impact varies over time.

Seasonally adjusted data are preferred by some users for analyzing general earnings trends in the economy since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude each year and, therefore, reveal the underlying trends and cyclical movements. Changes in average earnings may be due to seasonal changes in the proportion of workers in high-wage and low-wage industries or occupations or to seasonal changes in the amount of overtime work, and so on.
